

Dragnet[®] Dusting Tips

Equipment

- Ladder
- Torch
- Cordless Duster

Chemical

- Dragnet Dust (20g/kg Permethrin 40:60)

Application of dust in roof void

- Inspect interior before entering the roof void check for exhausts fans or ceiling vents and close vents
- **Turn on exhausts fans.** This will increase airflow into the roof void and prevent dust from the ceiling void from entering the living area of the house.
- Blow **ONLY** air into the roof space first before attaching the dust pot. This allows the dust to move further into the void
- Move to the furthest point from the roof access point, after partially or fully closing the roof access hole. This is to prevent dust from entering the living area.
- Attach dusting pot, begin applying working your way back to the manhole ensuring the best coverage possible.
- As part of best practice you should always clean up and conduct an inspection to ensure site is clean and no debris has fallen onto clients floor.
